

PROJECT PROFILE

Project Name:

Tranquility Management Habitat
Restoration

Project Customer:

Tranquility Management

Project Location:

Costa Rica

Martin EcoSystems Product:

BioHaven® Floating Islands

Application:

Habitat Restoration

Application Summary

BioHaven® Floating Islands were installed into a 42 acre artificial fresh water lake creating a habitat for native bird species, fish and wildlife. The primary goal of this project was to produce sufficient populations of baitfish, thus allowing for the stocking of gamefish. The pond was originally stocked with snook, corvine, and several other marine species.

Solution

Chad Parker, land manager for Tranquility has mentioned that, "BioHaven® Floating Islands have proven to be effective at sheltering and providing for increased fish populations, as well as, species growth. In fact biologists have also found a species of shrimp that was not part of the original stocking. They also have milk fish in the lake which are pretty rare and desirable to catch on a fly rod. For some reason they love to circle the islands."
